

# My Loc

Keep all your places of interest here!

The project offers users a way to keep record of all their places of interest, which they have visited or intent to visit.

On its home page users can see the places ordered in rows by Category, City and Address.

Above these columns we have filter where the users can easily filter only specific places.

## Welcome to MyLoc

### Home: Public Places

<u>Category</u>	<u>City</u>	<u>Address</u>
<input type="text"/>	<input type="text"/>	<input type="text"/>
1 <u>Cinema</u>	2 <u>Sofia</u>	3 <u>Some address in Sofia</u>
<u>Theatre</u>	<u>Plovdiv</u>	<u>Some address in Plovdiv</u>
<u>Car Service</u>	<u>Varna</u>	<u>Some address in Varna</u>

The project has been implemented both with server and client sides (1 and 2).

In order to launch it we have to enter the respective directories and run:

**plackup -R . /bin/app.psgi** for the Dancer2 standalone service

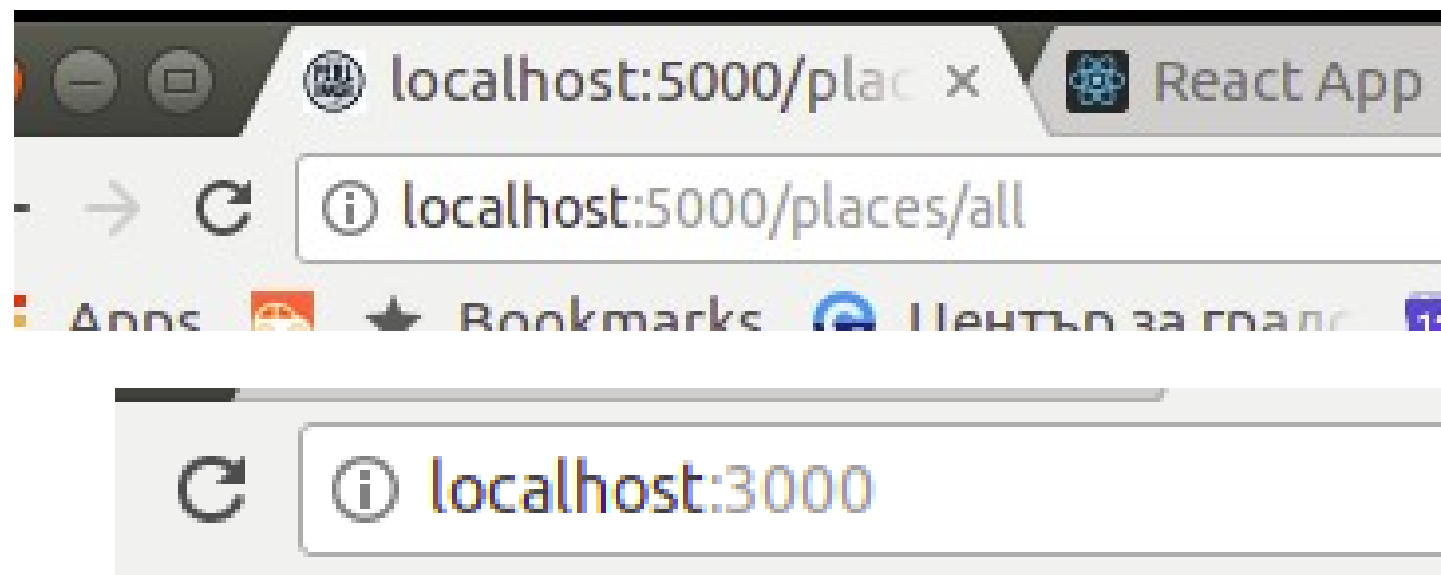

and

**npm start** for React

```
HTTP Server :: PSGI: Accepting connections at http://0.0.0.0:3000/  
^C  
→ MyLoc git:(master) X plackup -R . bin/app.psgi
```

```
→ my-loc git:(master) X npm start
```

Dander runs on port 5000, and react – 3000.

When clicked on some of the place rows, the places are expanded. Inside the opened tab there is more complete information about the place, if it is private or public, a picture of it, as well as its latitude and longitude coordinates.

This info cannot be edited when the place is public and on the home page.

There are three layers of users of the service:

- 1) Unregistered visitor
- 2) Registered visitor
- 3) Admin

Whenever the user has logged in as Admin, he can see the link List All Users. There he can manipulate the other users in bulk: Update them, delete them etc...

The project has been structured in components. Apart from the main App component, we have also common (DataField, Footer, Header), Users (All, LogIn, Logout, Register) and Places (AllPlaces, Gmap and MyPlace).

**That's all!**

**Thanks!**
